Sub-sub-sub heading for section   Text for this sub-sub-sub-heading . . . In this section we examine the growth rate of the mean of Z_0, Z_1 and Z_2. In addition, we examine a common modeling assumption and note the importance of considering the tails of the extinction time T_x in studies of escape dynamics. We will first consider the expected resistant population at vT_x for some $v > 0$, (and temporarily assume $\alpha = 0$)

$$E\big[Z_1(vT_x)\big] = E\bigg[\mu T_x \int_0^{v\wedge 1} Z_0(uT_x) \exp\big(\lambda_1 T_x(v - u)\big)\, du\bigg].$$

If we assume that sensitive cells follow a deterministic decay $Z_0(t) = xe^{\lambda_0 t}$ and approximate their extinction time as $T_x \approx -\frac{1}{\lambda_0} \log x$, then we can heuristically estimate the expected value as

$$
\begin{aligned}
E\big[Z_1(vT_x)\big] &= \frac{\mu}{r} \log x \int_0^{v\wedge 1} x^{1-u} x^{(\lambda_1/r)(v-u)}\, du \\
&= \frac{\mu}{r} x^{1-\lambda_1/\lambda_0 v} \log x \int_0^{v\wedge 1} x^{-u(1+\lambda_1/r)}\, du \\
&= \frac{\mu}{\lambda_1 - \lambda_0} x^{1+\lambda_1/rv}\bigg(1 - \exp\Big[-(v\wedge 1)\Big(1 + \frac{\lambda_1}{r}\Big) \log x\Big]\bigg). \quad (1)
\end{aligned}
$$

Thus we observe that this expected value is finite for all $v > 0$ (also see [1, 2, 3, 4, 5]).
